Version 1.0.0 | August 2026

Dashboard Overview

The RMG Manufacturing & Business Performance Dashboard provides an interactive view of business, order, shipment, production, factory, and quality performance.

The dashboard is organized into four pages, with each page focusing on a specific area of the business. Users can use the available filters to compare performance and explore trends across different business dimensions.

Dashboard Structure

Page 1 — Executive Overview

The Executive Overview provides a high-level view of overall business and operational performance.

Key KPIs

- Total Order Value
- Total Orders
- Production Achievement %
- On-Time Shipment %

Main Analysis

The page focuses on:

- Order value trends
- Shipment performance
- Monthly production target vs actual
- Production performance by factory

Business Insight

The Executive Overview provides a consolidated view of order, production, and shipment performance, helping users quickly identify overall performance and areas that require further analysis.

Page 2 — Order, Buyer & Shipment

This page focuses on order, buyer, and shipment performance to understand customer contribution and logistics performance.

Key KPIs

- Average Order Value
- Total Freight Cost
- On-Time Shipment %

Main Analysis

The page evaluates:

- Buyer performance
- Order value and quantity
- Freight cost by factory
- Planned vs actual shipments
- Shipment performance

Business Insight

The page helps identify major buyers, compare order performance, and understand shipment and freight cost differences across factories.

Page 3 — Production & Factory Performance

This page focuses on factory and production performance.

Key KPIs

- Actual Production
- Production Achievement %
- Production Efficiency %
- Lost Time %

Main Analysis

The page evaluates:

- Production achievement by factory
- Production output by line
- Production efficiency by factory

Business Insight

The analysis helps compare factory performance and identify differences in production achievement and efficiency.

Page 4 — Quality & Process Performance

This page focuses on quality and process performance across finishing and dyeing operations.

Key KPIs

- Finishing Reject %
- Dyeing Batch Loss %
- Dyeing Reprocess %

- Finishing Packing Rate %

Main Analysis

The page evaluates:

- Finishing reject quantity by factory
- Finished vs packed quantity
- Dyeing reprocess rate by factory
- Monthly reject trends

Business Insight

The analysis helps identify differences in quality performance, reprocessing levels, rejection quantities, and packing performance across factories and over time.

Key Areas Identified for Analysis

The dashboard highlights several areas that are important for monitoring overall business and operational performance:

- **Order & Buyer Performance** — Understanding order value, order volume, and buyer contribution.
- **Shipment Performance** — Monitoring on-time shipments, planned vs actual shipments, and freight cost.
- **Factory & Production Performance** — Comparing production achievement and efficiency across factories and production lines.
- **Quality & Process Performance** — Monitoring finishing rejects, dyeing loss, reprocessing, and packing performance.
- **Operational Trends** — Reviewing monthly changes in production, shipments, and quality-related performance.

Key Takeaways

The dashboard analysis highlights several important performance areas:

- **Production efficiency is 67.60%**, with noticeable differences in efficiency across factories.
- **Dyeing reprocess rate is 12.33%**, indicating that reprocessing is an important area to monitor within the dyeing process.
- **Dyeing batch loss is 4.02%**, providing a useful measure of material loss during dyeing.
- **Finishing reject rate is 3.35%**, while reject quantities vary across factories and months.
- **Finishing packing rate is 96.54%**, indicating a high proportion of finished garments progressing to packing.
- Factory-level comparisons highlight differences in production and quality performance.
- Monthly trends highlight changes in production and quality performance over time.

Business Recommendations

Based on the dashboard findings, the following areas should receive further attention:

- **Review lower-performing factories** to understand the operational factors affecting production efficiency and achievement.
- **Investigate dyeing reprocessing** to identify recurring causes and opportunities to reduce rework.
- **Monitor dyeing batch loss** to identify opportunities for improving material utilization.
- **Review finishing rejects** by factory and month to identify recurring quality issues.
- **Maintain packing performance** while monitoring the gap between finished and packed quantities.
- **Monitor shipment performance and freight costs** to identify potential logistics improvement opportunities.
- **Use monthly trends regularly** to detect performance changes early and support timely operational decisions.

Conclusion

The dashboard brings together key business and operational metrics into a single interactive reporting solution.

It provides a clear view of order, shipment, production, factory, and quality performance, helping users compare performance, monitor trends, and identify areas that may require further investigation.
